

LONG-LASTING DURABILITY

AquaSpada contains no electricity, no filters to change, no moving parts, and no maintenance. The original prototype of over 20 years is still operating the same today as when first put on.

Most Energy Efficient Method to Increase Your Water Quality and Reduce Chemical Consumption.

ENHANCE YOUR WATER

ELIMINATES 99.3% of ALL BACTERIA & ALGAE

AquaSpada helps eliminate 99.3% of bacteria and algae, significantly reducing the amount of chemicals needed to sanitize your pool.

How it works: Ions are released and designed to eliminate the bacteria and algae while inside the AquaSpada without adding minerals to your pool water.

NATURALLY CLARIFIES WATER

Submicron particles make the water cloudy and less inviting. They also provide a refuge for contaminants.

AquaSpada solution: By eliminating submicron particles naturally it helps reduce chemicals required to keep the pool sanitized and give you that crystal clear water.

How it works: A negative charge is imparted to all submicron particles causing them to aggregate and become larger to get caught in the filter.

PROTECTS SURFACE (from scale & staining)

AquaSpada keeps the swimming environment cleaner, healthier, and looking good. Pool owners won't have to spend much time with a brush in their hand.

How it works: H_2O goes into the AquaSpada and super bursts into a bunch of bubbles causing it to go from a liquid to a vapor then back to liquid. The new liquid that is formed is called H_3O^+ (structured water). H_3O^+ has different properties than H_2O . It's highly exclusive and forms at hydrophilic surfaces such as pool surfaces and equipment. When the H_3O^+ comes out of the AquaSpada it bonds to the pool surfaces and equipment creating a barrier making scaling more difficult to occur.

As an added bonus, AquaSpada will help remove existing scale over time.

PROTECTS THE SWIMMER

Chlorine can leave skin feeling dry, can leave eyes red and irritated, and is linked to health issues.

AquaSpada solution: Your skin will not absorb, to a very high degree, the amount of chemicals or contaminants present in the water.

How it works: Your skin is a hydrophilic surface and when you jump into an AquaSpada swimming pool, you are immediately enveloped with structured water and a barrier is created around your body.

ELIMINATES ACIDS

High cyanuric acid levels can damage your pool liner and plaster, contribute to false water chemistry readings, and reduce your chlorine's ability to sanitize. The AquaSpada unit will gradually eliminate the excess acids so you won't have these problems.

How it works: Cyanuric and other acids begin to decompose at 360 degrees. The AquaSpada has specialty nozzles and discs inside. When the water is pushed through the nozzles and discs they super burst into a bunch of bubbles. About 1/3 of those bubbles will get past that 360 degrees causing the acids to gradually reduce.
